

cloning and expression vectors pdf

A cloning vector need not contain suitable elements for the expression of a cloned target gene, such as a promoter and ribosomal binding site (RBS), many however do, and may then work as an expression vector. The target DNA may be inserted into a site that is under the control of a particular promoter necessary for the expression of the target gene in the chosen host.

In molecular cloning, a vector is a DNA molecule used as a vehicle to artificially carry foreign genetic material into another cell, where it can be replicated and/or expressed (e.g.- plasmid, cosmid, Lambda phages). A vector containing foreign DNA is termed recombinant DNA. The four major types of vectors are plasmids, viral vectors, cosmids, and artificial chromosomes.

A variety of other gene delivery techniques, largely sub-divided between viral and non-viral methodologies, have come into use over the last few decades (). In addition to adenovirus (AdV), lentivirus (LV), herpes simplex virus (HSV), adeno-associated virus (AAV), and baculovirus have also been studied for use in gene therapies.^{1, 3} Within the non-viral subclass, techniques utilizing naked DNA ...

Chagas disease or American trypanosomiasis affects six to seven million people worldwide, mostly in Latin America. This disease is transmitted by hematophagous insects known as "kissing bugs" (Hemiptera, Triatominae), with *Triatoma infestans* and *Rhodnius prolixus* being the two most important vector species. Despite the fact that both species present the same diploid chromosome number (2n ...

Introduction. Embryonic stem (ES) cells, which are derived from the inner cell mass of mammalian blastocysts, have the ability to grow indefinitely while maintaining pluripotency and the ability to differentiate into cells of all three germ layers (Evans and Kaufman, 1981, Martin, 1981). Human ES cells might be used to treat a host of diseases, such as Parkinson's disease, spinal cord injury ...
