In computer science, the clique problem is the computational problem of finding cliques (subsets of vertices, all adjacent to each other, also called complete subgraphs) in a graph. It has several different formulations depending on which cliques, and what information about the cliques, should be found. Common formulations of the clique problem include finding a maximum clique (a clique with ...

Gaussian Processes and Kernel Methods Gaussian processes are non-parametric distributions useful for doing Bayesian inference and learning on unknown functions. They can be used for non-linear regression, time-series modelling, classification, and many other problems.

Euler's formula states that if a finite, connected, planar graph is drawn in the plane without any edge intersections, and  $v$  is the number of vertices,  $e$  is the number of edges and  $f$  is the number of faces (regions bounded by edges, including the outer, infinitely large region), then  $v - e + f = 2$ . As an illustration, in the butterfly graph given above,  $v = 5$ ,  $e = 6$  and  $f = 3$ .

Fracture patterns can be mapped from the exposure of rock outcrops or man-made excavations (e.g. borehole, quarry, tunnel and roadcut). These geologically-mapped fracture networks were widely used to understand the process of fracture formation, interpret the history of tectonic stresses, and derive the statistics and scaling of fracture populations.
