Confabulation theory proposes that all aspects of cognition (seeing, hearing, command of movement and thought, planning, language, abstract thinking, etc.) are implemented using four fundamental elements: (1) a universal modular system for representing the objects of the mental world, (2) knowledge links, (3) confabulation, and (4) action command origination.

comprehensible scientific theory of how thought works: confabulation theory. Experiments with computer-simulated versions of the theory's proposed neuro-physiological components are presented. These demonstrate information-processing characteristics and capabilities that support the theory's scientific viability.

Confabulation Theory hypothesizes that the control of thinking is a direct evolutionary outgrowth of the control of movement. Establishing a complete understanding of Confabulation Theory will require launching and sustaining a massive new phalanx of confabulation neuroscience research.

The mechanisms found to underlie provoked confabulations can be applied to spontaneous confabulation mechanisms. The basic premise of researching confabulation comprises finding errors and distortions in memory tests of an individual.

Hypothesis/theory. We advance a model of characteristics and underlying mechanisms for false memories. Many recent experimental investigations of this phenomenon in normal people, along with related functional magnetic resonance imaging (fMRI) studies, are clarifying our understanding of the false memory syndrome.

Finally, if confabulations are caused by specifiable lesions, the theory fails to account for why these lesions so infrequently cause permanent confabulation or even, at times, any confabulation at all (see Alexander, 2011).
